Extended data compression activated.

Extended data security.

USER 1 of 10

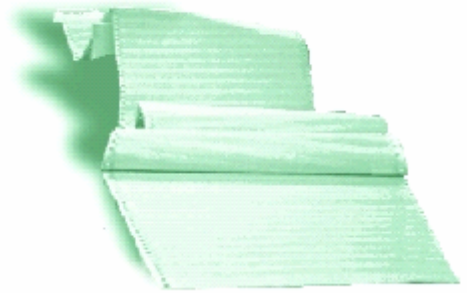

OdinView for Odin® COLD/ERM systems, provides the ideal data retrieval system for all company reports and computer generated customer documents.

Users can easily locate, retrieve, view, browse, search, print and fax bank account statements, tax documents, 1099's, 1098's, stock trade confirmations, brokerage statements, utility bills, literally any printed computer generated text based document!!!

- Text Search (simple and powerful)
- Data Extraction, Data Mining
- Automatic Currency Field Totals
- Favorite Places Menu
- Selectable Fonts & View
- Data Export (database or flat file)
- Enhanced Security By Report Title

- Report Notations
- Direct Interface to MS Excel
- Date Range Search
- Multi-Report Search
- Data Mining Tools, Field Name Query & Multi-line Record Support
- Multi-Report View

OdinView, COLD/ERM System

Annotations can now be attached to a report or placed on a specific page of a report. The system handles both public and private notes, all of which can be viewed by the OdinView System Administrator. This feature is ideal for banking environments where notations must be made on certain reports.

Date Range OdinView gives the option of opening all of the dates for a given report in a single window making it easier to search across time for the desired data. Data Extractions are easier in this case because all of the dates extracted are placed in a single resultant table for filtering (querying) and export.

Data Extraction allows for full maintainability of any saved extraction template. It also provides for multi-line extractions, intuitive field definitions, and exception and tag processing to help you limit and qualify the types of data extracted from report pages.

Record Search uses the field definitions in the Extraction Template to query the report using logical record support (multi-line record handling) without actually extracting the information to a separate table or database. The user can also save the query for later use. The same process can be used to physically extract the logical records from the report to create an extracted text file containing only those qualified records.

Variable Line Skipping further enhances the functionality of Extraction templates to perform searches and extractions on reports, which contain variable length records (e.g., multi line records where the number of lines varies from one group to the next.)

Carry-over Fields are used for reports that have records which do not contain the primary key information repeated on every detail line. Carry-over fields are automatically repeated for the purposes of data extraction so that the resulting table will contain the pertinent information for each table row. Without this feature, a number of table entries could contain blank information for such critical; data as account number, etc.)

Hide Columns allows users to reformat report pages to hide selected columns of data. OdinView resizes the page to fit after "clipping" the hidden columns. Subsequent searches operate only on displayed data and not on data that is hidden.

Sub-Directory Search Option can now be turned off to provide a significant performance boost when searching for reports and statements in a date range.

Data Synchronization now highlights the line, which contains the target data elements in an extracted table view making it easier to locate the desired line in the report text view.

The security administrator now has the ability to set **Print Limits** and **Data Extraction Limits** on a system-wide basis and per user basis. This is ideal for limiting print jobs in the event that a user inadvertently sends a run-away print request from Odin to the network. This feature insures that no-run-away print jobs can hit the network. Extraction Limits control the number of pages a user may extract from in a single request. Both limits were designed to control user initiated events that attempt to deal with thousands of print pages in error.

Rapid Pagination was added to the forward and reverse pagination VCR navigation buttons to allow the user to click and hold the button for automatic and rapid pagination.

Green-Bar Display option improves readability of reports on screen.

Enhanced Security (Optional - additional cost) Provides report level security based on user id. Easy administration and increased security for sensitive reports are key reasons to implement the OdinView Enhanced Security option.

OdinView is fully compatible with existing Odin databases, enhanced and standard Data Compression, parameter and index files. We have a solution for all of the Windows desktop platforms .
