Integrated Financial Systems (IFS), Developers of Odin® Document Management Software, Adds New Product Line and Depth of Services

SyAM Software's ManageAnywhere® Solutions Open New Doors At Accounts Concerned With Continual Asset Monitoring Due To Compliance Requirements.

(April 19, 2006 - Nashua, NH)

Integrated Financial Systems (IFS) of North Haven, Connecticut is announcing today a partnership with SyAM Software, a developer of IT management and monitoring software for the SMB market. SyAM Software's products provide proactive system area management, enabling companies to closely monitor and prevent outages before they occur.

Recognizing the need for simple, yet powerful tools to help managers and system administrators proactively take control of their complex IT environments, IFS became an Authorized Solution Provider of SyAM Software. SyAM Software's ManageAnywhere™ provides full central monitoring and remote access to all managed systems, including servers, desktops, notebooks, and storage devices, from anywhere across the IP network. Warnings and critical alerts assist administrators in pinpointing the root cause of a problem. Through a single, easy-to-use browser-based user interface, administrators can make the necessary corrections preventing costly downtime and data disruption.

"We are pleased to have IFS join our reseller team," says Kevin Regan, VP Sales North America for SyAM Software. "They are seasoned professionals who really understand the value of our product solutions," states Mr. Regan.

"Today's IT environment is more complex and mission critical than ever," says Dave DiVincenzo, President of IFS. "This is due to the proliferation of the Internet, mobile technology, wireless, and the increasingly important role of information technology in organizational productivity. System failure now results in productivity loss, increased costs and negative impact to the business," says Mr. DiVincenzo.

Mr. DiVincenzo also states that he recognizes the value of offering Odin® Document Technologies in concert with SyAM Software's ManageAnywhere™. "The two products, operating at different levels in the IT spectrum, offer similar benefits to administrators about system and data level usage status and activities. This information helps to address infrastructure management and monitoring and document management and retrieval with corporate information usage monitoring," says Mr. DiVincenzo. "This fits nicely with the growing 'data stewardship' role of the Odin system in terms of collecting, storing, indexing and delivering critical corporate and client data, on demand to internal users - all while managing and applying defined access privileges and logging traceability and usage information in detail for audit purposes."

Good governance is increasingly being seen as the hallmark of a well-run company. The Sarbanes-Oxley Act of 2002 requires publicly held companies to implement internal controls over their financial reporting, operations and assets. Because most companies' financial reporting and operations depend heavily on information technology, and because many corporate assets now exist in the form of critical data, SOX has significant information security implications for

companies governed by the law. Today's legal and regulatory oversights of corporate governance no longer permit the passive/reactive administration methods. Rather, it is expected that operational and data usage issues are proactively known and managed in order to prevent unauthorized data usage and system failures that are potentially harmful to the corporation. With its new combined product offerings, IFS is establishing itself in a role to provide innovative technology products to address these contemporary issues and requirements.

"IFS always strives to provide economical, high-performance technology solutions to our client base," says Mr. DiVincenzo. "Our relationship with SyAM Software is important because it allows us to expand our product offerings at different levels of the Information Technology spectrum."

About IFS:

Founded in April of 1990, IFS represents over 125 years of information technology and data processing experience. With headquarters in North Haven, Connecticut, IFS has provided software engineering, product development and professional services to the financial service, healthcare, manufacturing, and retail industries, with a primary focus placed on financial services and specifically banking. During the last several years, IFS has specialized in COLD Enterprise Report Management, Document Management and Check Imaging Systems for the financial banking and credit union industries. It produces, markets, sells and implements Odin COLD System solutions and provides complete product life-cycle support and on-going maintenance services. Integrated Financial Systems products are marketed and sold directly by the company and through a network of independent sales representatives and associates, at the present time, specializing in the financial industry.

IFS offers its innovative [Odin®](#) document management suite, including COLD/ERM report management, branch item/check capture and check imaging, general low-cost document imaging and specialized signature capture solutions. IFS is an Authorized SyAM Software Solution Provider, offering cost-competitive and innovative System Area Management software to monitor network devices and aid IT administrators in proactively managing corporate computing assets. Since inception, the IFS software engineering and product support team has created the entire Odin® product suite.
